Changes Log

Version	Date	Changes
1.0.0	2014-03-27	Creation
2.3.0	2016-11-25	Update for Sen2Cor V.2.3.0
2.4.0	2017-07-18	Update for Sen2Cor V.2.4.0
2.6.0	2018-02-23	Updates for Sen2Cor V.2.6.1: Updated all GIPP Schemes and description Resolved RIDS from TAS.
2.7.0	2018-09-21	Updates for Sen2Cor V.2.7.0: added GIPPs for Database compression factor and disabling of terrain correction with DEM. Added further command line parameters for determining database location.
2.8.0	2019-01-29	Updates for Sen2Cor V.2.8.0: removed parameter Nr_Processes and added parameters Nr_Treads and Ac_Dem_P2p_Val
2.9.0	2020-07-01	Updates for Sen2Cor V.2.9.0: added parameters for Section Region_Of_Interest and Force_Exit_On_DEM_Errors
2.10.0	2021-12-13	Updates for Sen2Cor V.2.10: updated with all the new input and output information from PSD-14.9 and Evolutionary Upgrades.
2.10.02	2021-04-19	Updates mirroring changes within Sen2Cor 2.10.02
2.11.0	2022-11-21	Updates mirroring changes within Sen2Cor 2.11
2.12.03	2024-09-10	Updates mirroring changes within Sen2Cor 2.12
2.12.04	2026-02-04	Updates mirroring changes within PSD 15.1 and Sen2Cor 2.12.04
2.13.02	2026-05-29	Updates following release of Sen2Cor 2.13.02

1 Introduction

1.1 Purpose of the document

This Document lists the Input-Output Data Definitions of the Sen2Cor application. This Document is updated with the corrective, perfective maintenance and evolutions present in the latest Sen2Cor 2.13.02 version [OMPC-TPZG-SRN].

1.2 Document Structure

This document includes new dedicated sections with all the input and output related to the evolutions implemented since Sen2Cor 2.10 and updates for 2.13.02 where present. Furthermore, this document lists for each of the following processes:

- ❖ Scene Classification;
- ❖ Atmospheric Correction, with sub-processes:
 - Aerosol Optical Thickness (AOT) retrieval;
 - Water Vapour retrieval;
 - Cirrus Correction;
 - Terrain Correction;
 - Surface Reflectance (Hemispherical-directional reflectance factor, HDRF);
- ❖ Quality Masks;

the corresponding Input and Output (I/O) data separated according the following four criteria (when applicable):

- ❖ Input Data;
- ❖ Ground Image Processing Parameter (GIPP);
- ❖ Metadata;
- ❖ Output Data.

2 Level-2A Products Overview

2.1 Common Data

This section lists I/O data and parameters that are related to the basic operation of the processor.

2.1.1 Input Data

The input data on pixel level and the L1C product formats are described in detail in [L2A-PFS], see also Table 2-1.

Table 2-1 – L1C Image data specification

Name	Level-1C
Parent Product	L1C, TOA Reflectance
Coverage	Regional. 110 km x 110 km
Packaging	MGRS Tiles (same area coverage as Level 1C input data)
Geo-location accuracy	Identical to the level 1C geo-location performance
Frequency	5 days repeat cycle with two Sentinel-2 satellites

2.1.2 GIPP

GIPPs are configured in an XML file named `L2A_GIPP.xml`, located in the `<cfg>` subdirectory of the Sen2Cor home directory which is specified by the environment variable `$SEN2COR_HOME`, and can be configured by the user. Exceptions, which should not be configured by standard users, are marked with an asterisk (*).

The file is subsequently copied into the `AUX_DATA` subfolder of the corresponding granule for documentation purposes.

Within this IODD the GIPP are listed within their current processing context. Figure 1 and Table 2-2 show and describe the GIPP, which are common for the overall processing. Specific GIPPs are listed in the corresponding subsections separated for each sub-processing step.

Figure 1 – GIPP of Common Section

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 7
---	--	---

Table 2-2 – Common GIPP

Field Name	Documentation	Type
Log_Level(*)	Verbosity level of the tracing output, located in the GRANULE/<GRANULE>/QI_DATA folder.	Enumerator: NOTSET, DEBUG, INFO, WARNING, ERROR, CRITICAL
Region_Of_Interest	This section has been established with release 2.9.0. It contains four parameters which define a configurable Region of Interest (ROI): - row0 - col0 - nrow_win - ncol_win row0, col0, nrow_win and ncol_win must be integer divisible by 6, to prevent rounding errors for downsampling. See SUM for Details.	Choice: Off, AUTO or: Unsigned Integer Values [0:10979] if row0 == OFF: a standard processing without ROI detection is performed; if row0 == AUTO: a region of interest is detected automatically via an algorithm; Else: row0, col0: specify the midpoint of the region of interest, nrow_win, ncol_win define a rectangle around the midpoint within a frame of 10980 x 10980 pixel
Product DOI (Since Sen2Cor 2.10)	DOI: Digital Object Identifier. This Object identifier is implemented since Sen2Cor 2.10 for PSD Versions 14.7 and above. The URL shall be inserted as a configuration item in this entry (The official URL is provided by ESA)	URL
Nr_Threads	This parameter allowing the usage of multithreading to speed up the reading of the L1C input images. above). It is set to AUTO by default, which detects the amount of usable threads by calling cpu_count(). If the user does not want this feature or want to set the number of threads individually, the parameter can be changed between a value of 1 (which is single thread processing, as before) up to 8.	Choice: AUTO or: Unsigned Integer Value [1:8]
Product Generator (Since Sen2Cor 2.10)	This parameter foresees the usage of the PDGS PSD converter in the toolbox mode. Not yet implemented.	Choice: Directory where the converter is located or 'NONE'

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 8
---	--	---

Field Name	Documentation	Type
DEM_Directory	Location of optional Digital Elevation Map, it should be either a directory in the sen2cor home folder or 'NONE'. 1) To use previously downloaded CDSE DGED DEM, set <DEM_Directory> to the local path where the DEM files are stored (e.g. dem/CopernicusDEM90_DGED). 2) To use the Copernicus DEM hosted by AWS, set <DEM_Directory> to the local path where the DEM files are stored (e.g. dem/CopernicusDEM90_AWS). 3) If no DEM is used, <DEM_Directory> should be set to 'NONE'. Example: 'dem/CopernicusDEM90_DGED' DEM will be searched in: <SEN2COR_HOME>/dem/CopernicusDEM90_DGED	Choice: NONE or String (relative directory path)

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 9
---	--	---

Field Name	Documentation	Type
DEM_Reference	DEM_Reference is used to 1) reference the DEM in the L2A Metadata and, alternatively, 2) to set the url where DEM can be automatically downloaded. 1) To use previously downloaded CDSE DGED DEM, set <DEM_Reference> to 'CDSE-GLO-30' or 'CDSE-GLO-90' (resolution, 30/90, is mandatory). 2) To use the Copernicus DEM hosted by AWS, set <DEM_Reference>https://copernicus-dem-90m.s3.eu-central-1.amazonaws.com/</DEM_Reference> 3) If no DEM is used, <DEM_Reference> should be set to 'NONE'. Since its version 2.12.01, Sen2Cor support the download of Copernicus DEM from the Amazon Web Service. Please Refer to the SUM: [OMPC-TPZG-SUM]. A tool is also available at the following link to download DEM geo-cells from the CDSE: senbox-org/CDSE-Copernicus-DEM-downloader	URL/STRING
Generate_DEM_Output	FALSE: no DEM output, TRUE: store DEM in the AUX data directory	FALSE or TRUE
Force_Exit_On_DEM_Error	This parameter has been established with release 2.9.0: if set to FALSE, processing continues with a flat surface, if a DEM is not found or cannot be downloaded. If set to TRUE, processing will be stopped.	FALSE or TRUE
Generate_TCI_Output	FALSE: no TCI output, TRUE: store TCI in the IMAGE data directory	FALSE or TRUE
Generate_DDV_Output	FALSE: no DDV output, TRUE: store DDV in the QI_DATA directory	FALSE or TRUE
Handle_L1C_QLT_Mask (Since Sen2Cor 2.10)	FALSE: no handling of the L1C Quality Mask. TRUE: handling L1C Quality Mask	FALSE or TRUE

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 10
---	--	--

Field Name	Documentation	Type
Downsample_20_to_60	TRUE: create additional 60m bands when 20m is processed	FALSE or TRUE
PSD_Version (Sen2Cor 2.10.01 and up)	Special entry for forcing a special PSD version to be processed. DEFAULT: automatic detection of the PSD version.	DEFAULT or PSD version
PSD_Scheme (*)	List of supported PSD Versions: V 14.2 – V.14.6 (since Sen2Cor 2.9.0) V 14.9 (since Sen2Cor 2.10) V 15.0 (since Sen2Cor 2.12.01) V 15.1 (since Sen2Cor 2.12.04) V 15.2 (since Sen2Cor 2.13.02) <u>Properties:</u> - Version: The PSD Versions - PSD_Reference: the names of the available PSD schemes <u>Names:</u> UP_Scheme_1C: <name> UP_Scheme_2A: <name> Tile_Scheme_1C <name> Tile_Scheme_2A <name> DS_Scheme_1C: <name> DS_Scheme_2A: <name> <u>Remark:</u> these schemes are used for validation of the in- and output metadata. The configuration should not be changed by the user	XML List of strings
GIPP_Scheme (*)	Name of the xsd scheme for the base GIPP (this file, used for validation purposes)	String (filename). Default is L2A_GIPP
SC_Scheme (*)	Name of the xsd scheme for the expert calibration GIPP for scene classification (used for validation purposes, not foreseen to be configured by standard uses).	String (filename). Default is: L2A_CAL_SC_GIPP
AC_Scheme (*)	Name of the xsd scheme for the expert calibration GIPP for the atmospheric correction (used for validation purposes, not foreseen to be configured by standard uses).	String (filename). Default is: L2A_CAL_AC_GIPP
PB_Scheme (*)	Name of the xsd scheme for the Processing Baseline.	String (filename). Default is: L2A_PB-_GIPP
QI_Scheme(*) (Sen2Cor 2.10.01)	Name of the xsd scheme for the L2A_Quality report	String (filename). Default is: L2A_QUALITY

For a full list of all types, parameters, and default values, please consult the embedded PDF in the 3.4.

2.1.3 Metadata

Metadata (Table 2-3) are read out directly from the Level 2A Tile metadata XML file after being generated from the corresponding Level-1C User product.

Table 2-3 – Metadata input fields (see L2A-PFS for details)

Field Name	Documentation	Type
ZENITH_ANGLE	Incidence angles	Floating point 32 bit
AZIMUTH_ANGLE	Incidence angles	Floating point 32 bit
Zenith	Grids for Zenith Viewing Incidence Angle values (0 - 70°)	Floating point array 32 bit
Azimuth	Grids for Azimuth Viewing Incidence Angle values (0 – 360°)	Floating point array 32 bit
QUANTIFICATION_VALUE	Digital Number of L1C Input bands, dimensionless, 0 :10.000 corresponds to TOA reflectance 0:1	Unsigned Integer
ECMWF_DATA_REFERENCE	Filename of the ECMWF data located in the GRANULE/AUX_DATA folder	String (filename)
Radiometric_Offset_List (since Sen2Cor 2.10)	List of band dependent radiometric offset	Integer

2.1.4 Auxiliary Data

Table 2-4 – Aux_Data

Field Name	Documentation	Type
DEM	Digital Elevation Map, user configurable image data located in \$SEN2COR_HOME, directory, configurable via L2A_GIPP, see Table 2-2 – Common GIPP Unit: m	In output of Sen2Cor, as OpenJPEG is only able to store unsigned integer values, an offset of +10.000 is applied to each DEM allowing for negative heights. The scale of the DEM is thus (meter – 10.000). Integer, 16 bit

 OPT-MPC Optical Mission Performance Cluster	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 12
---	--	---

Field Name	Documentation	Type
AUX_ECMWF, located in the GRANULE/AUX_DATA folder	Raster data of Block Size 9:9 in GRIB Format, 6 Bands, specifying: B1: Precipitable water content [kg/m ²] B2: Mean sea level pressure [Pa] B3: Total column ozone Dobson [kg/m ²] B4: 10m U wind component [m/s] B5: 10m V wind component [m/s] B6: Relative humidity [%]	Float 64
AUX_CAMSxx (Since Sen2Cor 2.10)	Raster data of Block Size 9:9 in GRIB Format, 11 bands of which the following are used: -Total Aerosol Optical Depth at 550nm (aod550); - Surface Geopotential (z)	Float 64

2.1.5 QI Data

Table 2-5 – QI_Data

Field Name	Documentation	Type
MSK_QUALIT_BXX (Sen2Cor 2.10)	List of band-depended quality masks to populate the L2A SCL defective pixel class.	Integer (0,1)

2.1.6 Output Data

Outputs are classified specifically for the corresponding procedures in the equivalent sections for the sub modules.

2.1.7 Command Line Parameters

In the following Table 2-6, the list of the command line parameters can be found. Lists are provided for both the PDGS and Toolbox modes.

Table 2-6 – Command Line Parameters

Command Line Parameters ("Toolbox" mode. L1C product as input_dir)
L2A_Process --h

                    [--cr_only] [--debug] [--GIP_L2A GIP_L2A]
                    [--GIP_L2A_SC GIP_L2A_SC] [--GIP_L2A_AC GIP_L2A_AC]
                    [--GIP_L2A_PB GIP_L2A_PB]
                    input_dir

Sen2Cor. Version: 2.13.02, created: 2026.05.29, supporting Level-1C product version 14.2 - 15.2.
positional arguments:
  input_dir              Directory of Level-1C input
optional arguments:
  -h, --help            show this help message and exit
  --mode MODE           Mode: generate_datastrip, process_tile
  --resolution {10,20,60}
                        Target resolution, can be 10, 20 or 60m. If omitted,
                        only 20 and 10m resolutions will be processed
  --datastrip DATASTRIP
                        Datastrip folder
  --tile TILE           Tile folder
  --output_dir OUTPUT_DIR
                        Output directory
  --work_dir WORK_DIR   Work directory
  --img_database_dir IMG_DATABASE_DIR
                        Database directory for L1C input images
  --res_database_dir RES_DATABASE_DIR
                        Database directory for results and temporary products
  --processing_centre PROCESSING_CENTRE
                        Processing centre as regex: ^[A-Z_]{4}$, e.g. "SGS_"
  --archiving_centre ARCHIVING_CENTRE
                        Archiving centre as regex: ^[A-Z_]{4}$, e.g. "SGS_"
  --processing_baseline PROCESSING_BASELINE
                        Processing baseline in the format: "dd.dd", where
                        d=[0:9]
  --raw                Export raw images in rawl format with ENVI hdr
  --tif                Export raw images in TIFF format instead of JPEG-2000
  --sc_only            Performs only the scene classification at 60 or 20m
                        resolution
  --sc_classic         Performs scene classification in Sen2Cor 2.9 mode
  --sc_cog             Export SCL image in COG format instead of JPEG_2000
  --cr_only            Performs only the creation of the L2A product tree, no
                        processing
  --debug             Performs in debug mode
  --GIP_L2A GIP_L2A    Select the user GIPP
  --GIP_L2A_SC GIP_L2A_SC
                        Select the scene classification GIPP
  --GIP_L2A_AC GIP_L2A_AC
                        Select the atmospheric correction GIPP
  --GIP_L2A_PB GIP_L2A_PB
                        Select the processing baseline GIPP
```

2.2 Scene Classification

2.2.1 Input Data

L1C Image data as specified in Section 2.1.1, resampled to the requested resolution of 60, 20, 10 m.

2.2.2 GIPP

Figure 2Figure 2 – GIPP of Scene Classification shows the GIPP of the Scene Classification Module, while Table 2-7 describes the related input.

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 14
---	--	--

Figure 2 – GIPP of Scene Classification

For a full list of all types, parameters and default values, please consult the L2A_GIPP.xml embedded PDF in 3.4. With and since Sen2Cor 2.11 the improved Scene Classification Evolution is used as default. User can switch to the classic algorithm by the command line `--sc_classic`. From Sen2Cor 2.10, the dedicated optional command line (`--sc_cog`) saves the Scene Classification output in COG (Cloud Optimized Geotiff) format.

Table 2-7 – GIPP of Scene Classification

Field Name	Documentation	Type
Median_Filter	Digital Filter for smoothing of Classification map.	Unsigned Integer, recommended values 0:3, Default: 0

2.2.2.1 Expert Level

GIPP for the Scene Classification on Expert Level are separated from the standard User level and are collected in a different file, named `L2A_CAL_SC_GIPP.xml`. Whereas `L2A_GIPP.xml` is a pure user configuration file and thus is available for a standard user, the Expert level GIPPs are reserved for testing and calibration campaigns. Wrong calibrations might lead to heavy performance artefacts. The description of these parameters is thus postponed to Section 3.1 and standard users are warned to leave these calibration parameters untouched. For a full list of all GIPPs including their types, values, and ranges, please consult the embedded PDF in section 3.4.

2.2.3 Metadata

Quality Information data on Tile level are part of the Tile metadata as summarized in Figure 3. The Entries represent the percentage of classified pixels as listed for Table 2-10, related to the total amount of valid data pixels. Valid data pixels do not consider the number of pixels classified as ‘no-data’ and ‘saturate-defective’ pixels. The sum of percentage of all valid pixels-classes is 100%. The list, with examples, of valid pixels classes is reported below:

```
<value name="CAST_SHADOW_PERCENTAGE">0.001868</value>
<value name="CLOUD_SHADOW_PERCENTAGE">0.043517</value>
<value name="VEGETATION_PERCENTAGE">8.204521</value>
<value name="NOT_VEGETATED_PERCENTAGE">50.011075</value>
<value name="WATER_PERCENTAGE">41.667086</value>
<value name="UNCLASSIFIED_PERCENTAGE">0.008281</value>
<value name="MEDIUM_PROBA_CLOUDS_PERCENTAGE">0.043139</value>
<value name="HIGH_PROBA_CLOUDS_PERCENTAGE">0.020053</value>
<value name="THIN_CIRRUS_PERCENTAGE">0.000464</value>
<value name="SNOW_ICE_PERCENTAGE">0.000000</value>
```

Quality Information data on User Product level are part of the User product Metadata. The structure follows the QI Data on Tile level as displayed in Figure 3. Additional metadata are specified in Section 2.1.3 and Table 3-1.

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 15
---	--	--

2.2.4 Cython Library

Since Sen2Cor 2.10, a new scene classification has been implemented. This requires a dedicated library (topographicshadows_cython_03) that is provided for each available operating system.

2.2.5 Auxiliary Data

The ESACCI-LC for Sen2Cor data package is prepared for users of Sen2Cor version starting with sen2Cor 2.5.5 which want to benefit from the last improvements of Sen2Cor Cloud Screening and Classification module. This auxiliary data information is used in Sen2Cor to improve the accuracy of Sen2Cor classification over water, urban and bare areas and to have a better handling of false detection of snow pixels.

Version 2.10 (and up):

For users of Sen2cor since version 2.10 (and up), the updated tar file ESACCI-LC-L4-ALL-FOR-SEN2COR-2.10.tar is available for download from this location:

<https://earth.esa.int/eogateway/ftp/Sentinel-2/ESACCI-LC-L4-ALL-FOR-SEN2COR-2.10.tar.gz>

The updated tar file including the updated snow monthly climatology shall be extracted at the following location of Sen2cor installation: '\$SEN2COR_BIN/aux_data'.

It contains two files and one directory:

- [ESACCI-LC-L4-LCCS-Map-300m-P1Y-2015-v2.0.7.tif](#)
- [ESACCI-LC-L4-WB-Map-150m-P13Y-2000-v4.0.tif](#)
- [ESACCI-LC-L4-Snow-Cond-500m-MONTHLY-2000-2012-v2.4](#)

In L2A_CAL_SC_GIPP.xml, the reference to the Snow climatology has been updated with the replacement of the ESA CCI Snow Weekly Condition by a derived Snow Monthly climatology.

<ESACCI_SnowCondition_Map_Dir>ESACCI-LC-L4-Snow-Cond-500m-MONTHLY-2000-2012-v2.4</ESACCI_SnowCondition_Map_Dir>

Versions 2.5.5, 2.8, 2.9:

The original ESACCI-LC for Sen2Cor data package (ESACCI-LC-L4-ALL-FOR-SEN2COR.zip) is available for download from this location:

<http://maps.elie.ucl.ac.be/CCI/viewer/download.php>

This zip file shall then be extracted at this location of Sen2Cor installation: '\$SEN2COR_BIN/aux_data/'

It contains two files and one directory:

- [ESACCI-LC-L4-LCCS-Map-300m-P1Y-2015-v2.0.7.tif](#)
- [ESACCI-LC-L4-WB-Map-150m-P13Y-2000-v4.0.tif](#)
- [ESACCI-LC-L4-Snow-Cond-500m-P13Y7D-2000-2012-v2.0](#)

Example on a Ubuntu (Linux) installation:

```
$ ls Sen2Cor-02.08.00-Linux64/lib/python2.7/site-packages/sen2cor/aux_data
ESACCI-LC-L4-LCCS-Map-300m-P1Y-2015-v2.0.7.tif
```

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 16
---	--	--

ESACCI-LC-L4-Snow-Cond-500m-P13Y7D-2000-2012-v2.0
ESACCI-LC-L4-WB-Map-150m-P13Y-2000-v4.0.tif

Example on a Windows 7 installation:

>dir Sen2Cor-02.08.00-Linux64/lib/python2.7/site-packages/sen2cor/aux_data
ESACCI-LC-L4-LCCS-Map-300m-P1Y-2015-v2.0.7.tif
ESACCI-LC-L4-Snow-Cond-500m-P13Y7D-2000-2012-v2.0
ESACCI-LC-L4-WB-Map-150m-P13Y-2000-v4.0.tif

NOTE-1: Please note that a Digital Elevation Model (DEM) is a pre-requisite for using ESACCI_LC information in the Scene Classification algorithm. In the case SRTM DEM is used, latitudes higher > 60 deg N (and lower < 60 deg S) are not covered by the SRTM DEM, therefore no ESACCI_LC information will be used for these latitudes. Standard Scene Classification algorithm will then be applied.

NOTE-2: Please note that it is possible to use symbolic links in this aux_data folder if you prefer to copy those auxiliary files to another data folder. (unix command: ln -s, windows command: mklink)

2.3 Atmospheric Correction

2.3.1 Input Data

L1C Image data as specified in Section 2.1.1, resampled to the requested resolution of 60, 20, 10 m. Scene Classification as specified in Section 2.2 resampled to the requested resolution of 60, 20, 10 m.

2.3.2 GIPP

Figure 4 shows the overall GIPP of the Atmospheric Correction Module. Table 2-11 reports the GIPP selection for the look-up tables.

Figure 4 – GIPP for Atmospheric Correction Module

Table 2-11 – GIPP for selection of Look_Up_Tables

Field Name	Documentation	Type
Aerosol_Type	The aerosol type used for atmospheric correction: a selection of AUTO will perform an automated aerosol type determination for this parameter as described in the SUM for Section 2.2.3.2. Default is: RURAL.	Choice: RURAL, MARITIME, AUTO
Mid_Latitude	The mid latitude used for atmospheric correction a selection of AUTO will perform an automated aerosol type determination for this parameter as described in the SUM for Section 2.2.3.2. Default is: SUMMER	Choice: SUMMER, WINTER, AUTO

Field Name	Documentation	Type							
Ozone_Content, Summer	The atmospheric temperature profile and ozone content for Mid_Latitude Summer Atmosphere. Default is: 0, which takes the best approximation from the ECMWFT metadata in the AUX_DATA folder of the input product. Otherwise the user can set the following numerical values: <table><tr><th>Dobson Units</th></tr><tr><td>250</td></tr><tr><td>290</td></tr><tr><td>331 (standard MS)</td></tr><tr><td>370</td></tr><tr><td>410</td></tr><tr><td>450</td></tr></table>	Dobson Units	250	290	331 (standard MS)	370	410	450	Choice as given

---	--	--

2.3.3 Metadata

NA

2.3.4 Auxiliary Data (Look Up Tables)

The algorithm for the atmospheric correction relies on a database of radiative transfer calculations using the DISORT 8-stream algorithm combined with the correlated k method. This has been converted to atmospheric LUTs based on the freely available `libRadtran` library.

Table 2-12 – Parameter space for atmospheric correction

Parameter	Range	Increment / grid points
Solar zenith angle	0 -70°	10°
Sensor view angle	0 -10°	10°
Relative azimuth angle	0 -180°	30° (180°= backscatter)
Ground elevation	0 -2.5 km	0.5 km
Visibility	5 -120 km	5, 7, 10, 15, 23, 40, 80, 120 km
Water vapour, summer	0.4 -5.0 cm	0.4, 1.0, 2.0, 2.9, 4.0, 5.0 cm
Water vapour, winter	0.2 -1.1 cm	0.2, 0.4, 0.8, 1.1 cm

The baseline processing uses the mid-latitude summer (MS) atmospheric temperature / humidity profile with scaled water vapour columns of 0.4, 1.0, 2.0, 2.9, 4.0, and 5.0 cm (sea level geometry). A separate LUT file is used for each water vapour concentration. The baseline aerosol type is rural (continental). Calculations are performed for the ground elevations 0 – 2.5 km above sea level, in steps of 0.5 km. The default value of the ozone content is 331 DU (for sea level, decreasing with elevation). The water vapour dependent LUTs are used during the per-pixel water vapour retrieval for Sentinel-2 scenes.

The baseline LUTs are compiled for the rural aerosol and the mid-latitude summer (MS) atmosphere with its corresponding ozone column (331 DU for sea level). Other LUTs are selectable via configuration.

Water vapour columns are calculated using an equidistant 100 m grid.

LUT file name conventions: a name consists of 16 characters or numbers followed by the extension ‘.atm’. The first character defines the atmospheric temperature profile (e.g. h=summer, w=winter) and ozone content, followed by ‘99000’ (indicating the symbolic satellite height of 99,000 m), followed by ‘_’, then ‘wvxy’ where xy is the sea-level water vapour column, followed by ‘_’ and a 4 letters aerosol identifier ‘_rura’.

Table 2-13 – LUT file naming conventions

Examples:	
h99000_wv29_rura.atm	MS atmosphere, water vapour=2.9 cm, rural, ozone=331 DU

Examples:	
w99000_wv11_rura.atm	MW atmosphere, water vapour=1.1 cm, rural, ozone=377 DU
Names for other aerosol types are coded with 4 letters, e.g.:	
h99000_wv29_mari.atm	MS, water vapour=2.9 cm, maritime, ozone=331 DU
h99000_wv29_urba.atm ¹	MS, water vapour=2.9 cm, urban, ozone=331 DU
h99000_wv29_dese.atm ¹	MS, water vapour=2.9 cm, desert, ozone=331 DU

The content are the following 6 radiative transfer functions for different atmospheric conditions, view angles 0° (nadir) and 10° off-nadir, and a range of solar geometries and relative azimuth angles.

Table 2-14 – Structure and format of the atmospheric LUT files

Column		Content
1.	Lp	path radiance
2.	Edf	diffuse flux at the sensor = (Tdir + Tdif)*Edif (where Edf is the diffuse solar flux at the ground)
3.	Edr	direct (beam) irradiance at the sensor= (Tdir + Tdif) * Tsun * E Where: Tsun is the sun-to-ground direct transmittance, E = extra-terrestrial solar irradiance
4.	Tdir	direct transmittance ground-to-sensor
5.	Tdif	diffuse transmittance ground-to-sensor
6.	s	spherical albedo of atmosphere

- ❖ The radiance, irradiance, and flux values are calculated for an earth-sun distance of 1 astronomical unit.
- ❖ Each LUT file stores the radiative transfer functions as float numbers in the binary platform independent XDR format.
- ❖ The Thuillier-2003 extra-terrestrial solar irradiance spectrum is used for the calculation of the LUTs (see Ref. Thuillier et al. 2003). It has been provided by ESA expressed in $\text{mW} \cdot \text{m}^{-2} \cdot \text{nm}^{-1}$ resampled at 1 nm.

¹ Currently not compiled

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 24
---	--	--

LUTs are calculated for:

- ❖ ne = 6 elevations (0-2.5 km, increment 0.5 km),
- ❖ nz = 8 solar zenith angles (0-70°, increment 10°),
- ❖ nv = 8 visibilities (5, 7, 10, 15, 23, 40, 80, 120 km), and
- ❖ nb bands: nb=12 for the 60 m data; nb=12 for the 20 m data; nb=4 for the 10 m data of Sentinel-2.

The sequence of data is arranged in a file with 104 columns and nz*nv*nb lines:

Table 2-15 – Column structure of atmospheric LUT files

Column	Content
column 1	Solar zenith angle (first 0°, last 70°)
column 2	Visibility (first 5 km, last 120 km)
columns 3 – 8	Lp, Edf, Edr, Tdr, Tdf, s (nadir view), elevation=0 km
columns 9 – 19	Edf, Edr, Tdr, Tdf, Lp for 7 rel. azimuth angles 0(30)180°, at sensor view angle 10°, elevation = 0 km
columns 20 – 104	Columns 3 – 19 are repeated 5 times for the remaining elevations 0.5 to 2.5 km (increment 0.5 km)

Note: the spherical albedo s is the same for nadir and 10° off-nadir, therefore it is stored only once.

The contents of the file are written as a simple float binary array $LUT = \text{fltarr}(2+17 * ne, nz, nv, nb)$ where the 17 radiative transfer functions are calculated for different parameter sets with ne (first=fastest loop = elevation), nz (second loop = solar zenith), nv (third loop = visibility) and nb (last loop = spectral band). Look Up Tables are located in two folders named lib_S2A and lib_S2B (for Sentinel 2A and Sentinel 2B satellites) as Sen2Cor subdirectories. These directories should never be changed or removed as they are essential for a proper atmospheric correction. Since Sen2Cor version 2.12.01, there is a third folder named lib_S2C for the Sentinel 2C MSI.

2.3.5 Output Data

Outputs are specified in the following subsections for the individual sub modules.

2.3.6 Aerosol Optical Thickness Retrieval

The aerosol optical thickness (τ) is defined as the integrated extinction coefficient over a vertical column of atmosphere of unit cross section. Extinction coefficient is the fractional depletion of radiance per unit path length (also called attenuation for radar frequencies). Example in formula:

$$I = I_0(e^{-\tau})$$

Default method in Sen2Cor for AOT retrieval is based on the Dense Dark Vegetation (DDV) method. However, if not enough DDV pixels are available within the Sentinel-2 image, Sen2Cor can switch to external sources for AOT information. Starting with L1C Processing baseline (PB) 4.00, Total Aerosol Optical Thickness is provided as input in the L1C product in the Granule/Tile/Aux_data where the related Copernicus Atmosphere Monitoring Service (CAMSFO or CAMSRE) file is present. Sen2Cor can retrieve the AOT required to perform the atmospheric correction from the *aerosol optical thickness* at 550 nm and the *geopotential* (*z*) contained in that CAMS auxiliary file.

2.3.6.1 Input Data

Band subset as specified in Section 2.1.1, resampled to corresponding resolution of 60, 20, 10 m (see Table 2-16 – Band subsets).

Table 2-16 – Band subsets

CAMSxx	Purpose in L2A Processing context
B2 (490nm): 10 m	Sensitive to Vegetation Aerosol Scattering
B4 (665nm): 10 m	Max Chlorophyll absorption
B12 (2190nm): 20 m	AOT determination

Input retrieval in Sen2Cor from the CAMS auxiliary file in case the number of DDV pixels is less than 1% (see Table 2-17).

Table 2-17 – CAMS auxiliary input

Variable and Raster Band number	Purpose in L2A processing context
AOD550	To retrieve the visibility map/index
Geopotential (z)	To retrieve the visibility map/index

2.3.6.2 GIPP

Figure 5 – GIPP for selection of Look_Up_Tables, shows the GIPP of the Atmospheric Correction Module for the selection of the Look Up Tables (LUTs).

Figure 5 – GIPP for selection of Look_Up_Tables

2.3.6.3 Metadata

Metadata are specified in Table 2-3.

2.3.6.4 Output Data

Table 2-18 – Aerosol Optical Thickness (AOT) map

Aerosol Optical Thickness (AOT) Map [Image Data]	
Unit	Unit less
Range	AOT = DN / 1000
Sampling	16 bit/pixel
Resolution	60 m, 20 m, 10 m (resampled from 20 m)

2.3.7 Water Vapour Retrieval

WV retrieval over land is performed with the Atmospheric Pre-corrected Differential Absorption algorithm (APDA) which is applied to the two Sentinel-2 bands B8A, and B9 (Fig. 4). Band 8A is the reference channel in an atmospheric window region. Band B9 is the measurement channel in the absorption region. The absorption depth is evaluated by calculating the radiance for an atmosphere with no WV, assuming that the surface reflectance for the measurement channel is the same as for the reference channel. The absorption depth is then a measure of the WV column content.

Typical ranges of water vapour columns are (sea-level-to space):

Table 2-19 – WVP columns

Conditions	WVP (g.cm-2, or cm)
tropical	3 - 5
midlatitude, summer	2 - 3
dry summer, spring, fall	1 – 1.5
dry desert or winter	0.3 – 0.8

2.3.7.1 Input Data

Band subsets are specified in Section 2.1.1, resampled to corresponding resolution of 60, 20 m.

Table 2-20 – Band subsets

Channels and Resolution	Purpose in L2A processing context
B8A (865nm): 20 m	Used for water vapour absorption (reference channel)
B9 (945nm): 60 m	Water Vapour absorption atmospheric correction (measurement channel)

2.3.7.2 GIPP

Table 2-21 – GIPP input fields

Field Name	Documentation	Type
WV_Correction	0: no water vapour correction 1: water vapour correction using band B8A	Enumerator 0,1 as stated, default: 1
WV_Watermask	A choice to set the water vapour values for water pixels: 0 = not replaced, 1 = average water vapour value of land pixels is assigned to water pixels, 2 = line average of water vapour of land pixels is assigned to water pixels. Only available with WV_Correction mode 1	Enumerator 1,2, as stated 1: default 2: for future use, currently unused
Smooth_WV_Map	smooth water vapour map [m]	Floating point, 32 bit, default: 100 m

2.3.7.3 Metadata

None

2.3.7.4 Output Data

Table 2-22 – Water Vapour Map

Water Vapour Map [Image Data]	
Unit	g.cm-2 (or cm)
Range	WVP = DN / 1000

Water Vapour Map [Image Data]	
Sampling	16 bit
Resolution	60 m, 20 m, 10 m

2.3.8 Cirrus Correction

2.3.8.1 Input Data

Table 2-23 – Band subset

Channels and Resolution	Purpose in L2A processing context
B10 (1375): 60 m	Detection of thin cirrus for atmospheric correction

2.3.8.2 GIPP

Table 2-24 – Inputs parameter cirrus correction

Field Name	Documentation	Type
Cirrus_Correction	Flag for cirrus removal TRUE: enabled FALSE: disabled	Restricted string, TRUE / FALSE as stated
WV_Threshold_Cirrus	Water Vapour threshold to switch cirrus algorithm off [%]	Floating point value, 32 bit, default: 0.25

2.3.8.3 Metadata

None

2.3.8.4 Output Data

Contribution of cirrus correction to Surface Reflectance for individual channels as listed in Section 2.3.10. The Cirrus band itself will be omitted in the Level 2A output, as it does not contain surface reflectance information and no direct user output.

 OPT-MPC Copernicus Sentinel Optical Mission Performance Cluster	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 29
---	--	--

2.3.9 Terrain Correction

2.3.9.1 Input Data

See metadata Section 2.3.9.3 below.

2.3.9.2 GIPP

Table 2-25 – GIPP terrain correction

Field Name	Documentation	Type
DEM_Directory	Directory where DEM will be expected. If set to 'NONE', no DEM is used and no terrain correction will be performed. Example: 'dem/CopernicusDEM90_DGED'	Formatted string
DEM_Reference	Example of url: https://copernicus-dem-90m.s3.eu-central-1.amazonaws.com/ Or 'CDSE-GLO-90(30)', case of previously downloaded CDSE-Copernicus DEM	Formatted string
DEM_Terrain_Correction	Boolean Flag for using DEM for terrain correction. Otherwise only used for scene classification and AOT	Formatted string
Altitude	Assumed altitude if no DEM is present [km]	Floating point value, 32 bit, default: 0.10, equals 100 m
BRDF_Correction	Empirical BRDF correction with factor (G) according to following equation: $G = \{ \cos(\beta_i) / \cos(\beta_T) \}^b \geq g \quad (\text{eq. 1})$ where: β_i: local solar zenith angle (from metadata, Section 1.1.3). β_T: threshold for surface reflectance (determined programmatically). b: exponent, set via options below. g: Lower boundary of BRDF correction factor, recommended between 0.2 and 0.25 (see next parameter, below). <u>Options to be selected (Exponent b):</u> 0: no empirical BRDF correction (or flat terrain) 1: correction with cosine of local solar zenith angle (eq. 1 with b=1) 2: correction with sqrt(cos) of local solar zenith angle (eq. 1 with b=1/2) correction).	Enumerator 0, 1, 2

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 30
---	--	---

Field Name	Documentation	Type
BRDF_Lower_Bound	Lower boundary of BRDF correction factor, should be between 0.2 and 0.25.	Float, default 0.22

2.3.9.3 Metadata

- DEM (as specified in the GIPP, will be internally prepared and adapted to geo-positional coordinates obtained from the JPEG-2000 image headers)
- Terrain Shadow Map (calculated internally via GDAL)
- Slope Map (calculated internally via GDAL)
- Aspect Map (calculated internally via GDAL)

2.3.9.4 Output Data

Corrections of Surface Reflectance retrieval for bands B01 – B12, except B10) as listed in Section 2.3.10. No separate user output.

2.3.10 Surface Reflectance (Hemispherical-directional reflectance factor, HDRF)

2.3.10.1 Input Data

60, 20 m Resolution

- ❖ Full set of Bands as specified in Section 2.1.1, Table 2-1, (except Band 8) resampled to corresponding resolution;
- ❖ Aerosol Map as specified in Table 2-18;
- ❖ Water Vapour Map as specified in Table 2-22;
- ❖ (Optional) Cirrus correction as specified in Section 2.3.8.4;
- ❖ (Optional) Terrain correction as specified in Section 2.3.9.4.

10 m Resolution

- ❖ Bands 2,3,4,8 as specified in Section 2.1.1, Table 2-1, no resampling;
- ❖ Resampled Aerosol Map as specified in Table 2-18;
- ❖ Water Vapour Map as specified in Table 2-22;
- ❖ (Optional) Terrain correction as specified in Section 2.3.9.4

2.3.10.2 GIPP

---	--	--

2.4 Quality Mask

Since version 2.10, Sen2Cor supports and handles L1C Quality Masks in raster format describing invalid pixels in the L1C input data.

2.4.1 Input Data

L1C_product/GRANULE/tile_id/QI_DATA/ contain MSK_QUALIT_BXX.jp2 (where XX is the ID of the bands) type files. The files with the affected bands are open and a mask is created.

2.4.2 GIPP

The L2A_GIPP.xml configuration file contains a new parameter: 'Handle_L1C_QLT_Mask' that must be set to 'TRUE' if the user wants to use the Quality Mask. This is set 'TRUE' by default since PB 04.00.

2.4.3 Metadata

Sen2Cor reads from the file GENERAL_QUALITY.xml (that is present in the folder L1C_product/GRANULE/tile_id/QI_DATA/) if loss of data is reported. In the affirmative case, it reads the list of the affected bands. Below, an example of a <check> from a GENERAL_QUALITY.xml reporting data loss and affected bands.

```
<check>
  <inspection creation="2018-01-19T21:58:24.747Z" duration="276" execution="2018-01-19T21:58:24.762Z" id="Data_Loss"
  item="S2B_OPER_MSI_L1C_TL_MTI__20180119T211945_A004558_T07LEK_N02.06"
  itemURL="/dpc/data/phoebus-share/PHOEBUS-3.4.1/wp_in_progress/l1c_20180119_17/app_data/steps_data/L1C/TILE/S2B_OPER_MSI_L1C_TL_MTI__20180119T211945_A004558_T07LEK_N02.06/" name="Check TECQUA for data loss "
  priority="5" processingStatus="done" status="FAILED"/>
  <message contentType="text/plain">There is data loss in this tile.</message>
  <extraValues>
    <value name="Affected Bands">B06 B07 B08 B09 B10 B11 B8A</value>
  </extraValues>
</check>
```

2.4.4 Output Data

The generated mask will be visible in all the L2A *.jp2 output (for example the *_TCL_*.jp2 file).

2.5 Product Generation

2.5.1 Input Data

All outputs from previous sections.

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 35
---	--	--

2.5.2 Output Data

The generated output is dependent on the command line input as shown below. The output products itself are described and specified in detail in [S2-PDGS-MPC-L2A-PFS] and thus not repeated here.

2.5.2.1 Datastrip Generation

Command Line Parameter:

```
L2A_Process --mode=generate_datastrip --datastrip=L1C_DATASTRIP
            --output_dir=L2A_OUTPUT_DIR --work_dir=WORK_DIR --processing_centre=PROCESSING_CENTRE
            --archiving_centre=ARCHIVING_CENTRE --GIP_L2A_PB=GIP_L2A_PB (optional)
            --resolution=RESOLUTION (optional)
```

Generates a datastrip with optional processing baseline settings, which can be used as input for the next step of processing a single tile.

Input product should be in SAFE standard format. Output product will have the datastrip directory in SAFE standard format as well, all other components like metadata and reports will be generated in SAFE compact format.

2.5.2.2 Tile Generation

Command Line Parameter:

```
L2A_Process --mode=process_tile --datastrip=L2A_DATASTRIP --tile=L1C_TILE
            --output_dir=L2A_OUTPUT_DIR --work_dir=WORK_DIR --GIP_L2A_PB=GIP_L2A_PB (optional)
            --resolution=RESOLUTION (optional) --img_database_dir=IMG_DATABASE_DIR (optional)
            --res_database_dir=RES_DATABASE_DIR (optional) --GIP_L2A = GIP_L2A --raw (optional)
```

Processes a tile with optional database locations and optional processing baseline settings, using a generated L2A datastrip as input. Database directories have been split into two different entities, one for the L1C image inputs, which will be kept in read only mode and a second database for the resampled auxiliary and intermediate products, which always will be overwritten and removed during the successive processing steps.

Input product should be in SAFE standard format. Output product will have the tile directory in SAFE standard format as well, all other components like metadata images and reports will be generated in SAFE compact format.

2.5.2.3 EUP Generation (Toolbox Mode)

Command Line Parameter:

```
L2A_Process input
usage: L2A_Process L1C_USER_PRODUCT --GIP_L2A_PB=GIP_L2A_PB (optional)
            --resolution=RESOLUTION (optional) --GIP_L2A = GIP_L2A
```

Processes an End User Product with optional processing baseline settings, using an L1C End User product of a given PSD as input. Input product should be V.14.(6-9), V.15.(0-2) SAFE compact format. Output product will also be generated in SAFE compact format. Older products below PSD 14.6 will no longer be supported. Since Sen2Cor Version 2.10, Sen2Cor converts product below PSD 14.6 to PSD 14.6.

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 36
---	--	--

2.5.2.4 Additional Output (since Sen2cor 2.11, PSD >= 14.9)

Since Sen2cor 2.10 (PSD>=14.9), additional output comprises:

1- Additional L2A Quality parameters have been added to the already existing parameter in the L2A tile metadata in the 'Quality_Indicator_Info' section. These include:

- ❖ Cloudy_pixel_over_land_percentage;
- ❖ AOT_retrieval_method;
- ❖ Granule_mean_AOT;
- ❖ Granule_mean_wv;
- ❖ Ozone_Source;
- ❖ Ozone_Value.

2- Provision of the L2A Quality Report (see Figure 6): the new L2A_Quality.xml report provides quality indicators information derived during the L2A process. They are separated in three main groups (that are subsequently divided into several subsections):

- ❖ Scene Class Quality Indicators;
- ❖ Atmospheric Correction Quality Indicators;
- ❖ Auxiliary Data Quality indicators.

A detailed description can be found at the end of the document in section 3.4.

Figure 6 – General schema of the new L2A_Quality file

	Optical MPC Sen2Cor 2.13.02 Input-Output Data Definition	Ref.: OMPC.TPZG.IOD.004 Issue: 1.0 Date: 29/05/2026 Page: 37
---	--	--

Note: Since Sen2Cor 2.12.01 and for products following PSD 15, the class <DARK_FEATURES_PERCENTAGE> is replaced by <CAST_SHADOW_PERCENTAGE> . Retro compatibility is maintained for product with PSD < 15.

Below an example of a L2A_Quality file processed with Sen2Cor 2.12.03:

```

3 GIPP Additional Settings

3.1 Expert Parameters for Scene Classification

The default expert parameters for the Scene Classification are located in a file named L2A_CAL_SC_GIPP.xml, located in the cfg folder of the sen2cor subdirectory within the Sen2Cor package. They can be overwritten with an external configuration referred to via command line (see section 2.1.7).

Figure 7 – Processing Baseline GIPP

For a full list of all types, parameters, and default values, please consult the embedded PDF in section 3.4.

3.2 Expert Parameters for Atmospheric Correction

The default expert parameters for the Atmospheric Correction are in a file named L2A_CAL_AC_GIPP.xml, located in the cfg folder of the sen2cor subdirectory within the Sen2Cor package. They can be overwritten with an external configuration referred to via command line (see section 2.1.7).

Figure 8 – Processing Baseline GIPP

For a full list of all types, parameters and default values, consult the embedded GIPP PDF in Section 3.4.

3.3 Processing Baseline Parameters

Figure 9 – Processing Baseline GIPP

Table 3-1 – Processing Baseline GIPP

Field Name / Attribute	Documentation	Type
DATA	Container for Instrument Data Processor Software Components	Complex
IDp_Sc_List	List of Software Components	Complex
workflow	Processing workflow level	String
IDp_Sc_Name	Software Component name	String
IDp_Sc_Version	Software Component version	String
Baseline_Version	Processing baseline	Double

Adding an optional xml input in the format of a processing baseline allows overwriting the corresponding fields in the metadata and filenames.

For a full list of all types, parameters, and default values, please consult the embedded PDF in section 3.4.

3.4 Additional Documentation

The full reference of all GIPPs is contained in the embedded PDF documents.

GIPPs from Sen2Cor 2.13.02 are embedded considering the release and implementation of PSD 15.2
